

AMENDMENTS TO THE CLAIMS:

Please amend the specification as indicated below:

1. (Currently Amended) A monovalent cation containing well fluid comprising: a[~~n~~] single aqueous monovalent brine system and an amount of a starch derivative selected such that the well fluid has the following characteristics:
 - (a) a low shear rate viscosity greater than about 5,000 centipoise;
 - (b) a high shear rate viscosity at 511 sec^{-1} in the range from about 15 to about 70 centipoise measured at 120°F, wherein the single aqueous monovalent brine system consists essentially of at least 0.6 equivalents per liter of a water soluble monovalent cation salt, wherein the anion of the salt is a halide, wherein the monovalent cation salt is substantially free of divalent cations, and wherein the well fluid is substantially free of xanthan gum.
2. (Previously Presented) The well fluid of claim 1, wherein the starch derivative comprises a pre-gelatinized crosslinked amylopectin starch which has been crosslinked to about 25% to about 60% of the maximum attainable viscosity.
3. (Original) The well fluid of claim 1, further comprising a particulate bridging agent which is substantially insoluble in the aqueous brine.
4. (Currently Amended) A method of treating a well that comprises:

adding a well fluid comprising a single monovalent aqueous brine system and an amount of a starch derivative selected such that the well fluid has the following characteristics:
